

X-ray CT and Applications at the Lawrence Livermore National Laboratory (LLNL)

2017 X-ray 2D and CT Symposium, Baltimore, MD

March 28-31, 2017

Harry E. Martz, Jr., NCI Director, LLNL

 Lawrence Livermore
National Laboratory

 Nondestructive
Characterization Institute

LLNL-PRES-727660 (IM-878307)

This work has been supported by the US Department of Homeland Security, Domestic Nuclear Detection Office, under competitively awarded contract/IAA HSHQDC-12-X-00341. This support does not constitute an express or implied endorsement on the part of the Government.

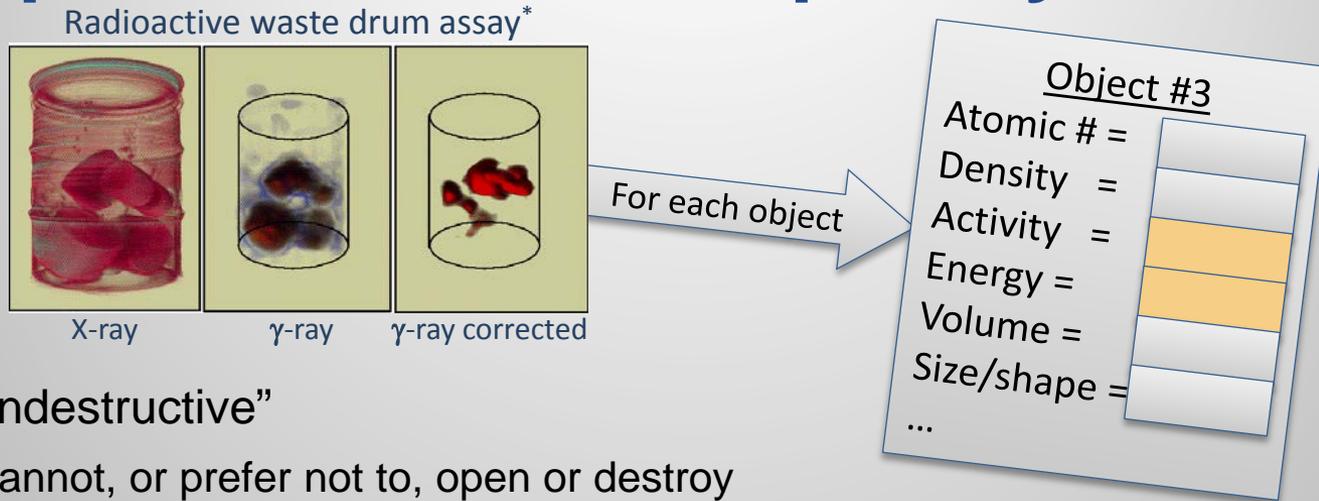

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under Contract DE-AC52-07NA27344. Lawrence Livermore National Security, LLC.

Outline

- Overview of Nondestructive Characterization at LLNL
- X-ray Radiography, CT, Diffraction and Applications
 - eV-to-MeV X-ray energies; nm-to-cm spatial resolution
 - H-to-Pu Z-range; mg/cm³-to-20 g/cm³ in density (ρ)
 - Hair-strand to Cargo-container object sizes
- Software & Supporting Technologies
 - Algorithms for CT acquisition, processing, reconstruction, analysis
 - Simulation & Modeling
- Other Modalities (Ultrasound, Radar, Particles, etc.)
- Future directions

Nondestructive Characterization (NDC) is complex and multidisciplinary

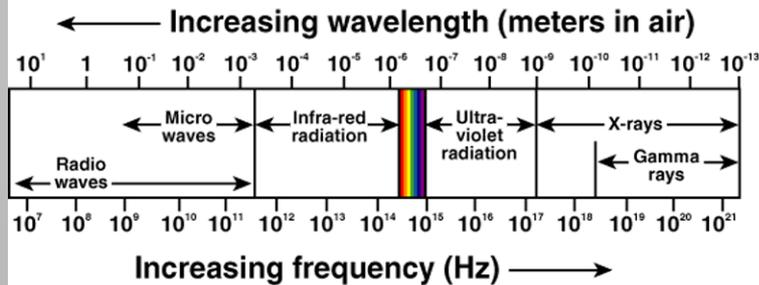

- “Nondestructive”
 - Cannot, or prefer not to, open or destroy
- “Characterization”
 - Not just images (e.g., spatial extent) ... need a full understanding of physical/chemical makeup to find subtle differences (e.g., threats vs. non-threats)
- NDC involves the use of sophisticated sources, detectors, data acquisition, simulation/modeling, algorithms, and computing

* R&D100 Award winning method developed by LLNL in 2000

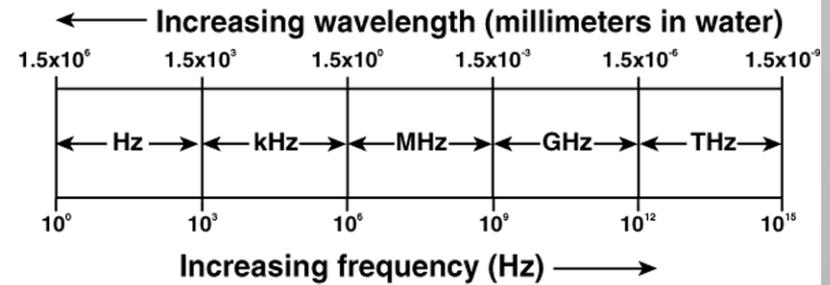

NDC at LLNL has been an important discipline at LLNL since its inception in 1952.

Waves (EM & Acoustic) and Particles help to “see” inside at multiple length-scales

Electromagnetic Spectrum

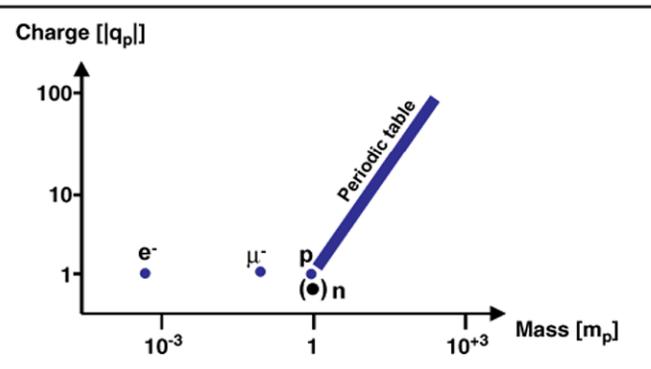

Acoustic Spectrum

Particles

Mesoscale range & resolution →

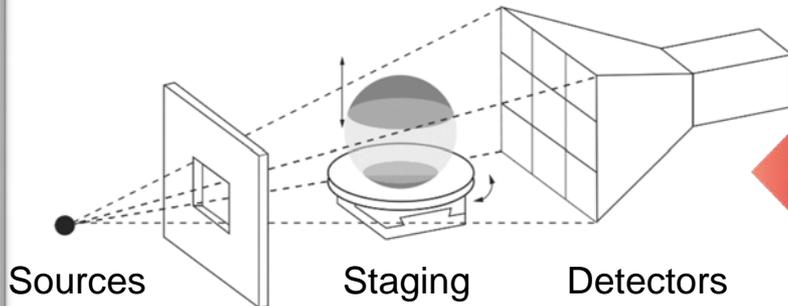

Particles:
Electrons
Protons
Neutrons
Positrons
Heavy Particles

NDC uses all practical physical inspection methods; X- and gamma-rays are most common.

Multiple technologies and disciplines are employed in NDC

Measurement Systems

Data Management & Processing

- Experimental Planning
- Instrument Control
- Data Acquisition
- Preprocessing
- Image Reconstruction
- Analysis Post-processing

Modeling & Simulation

Interpretation

Display & Analysis

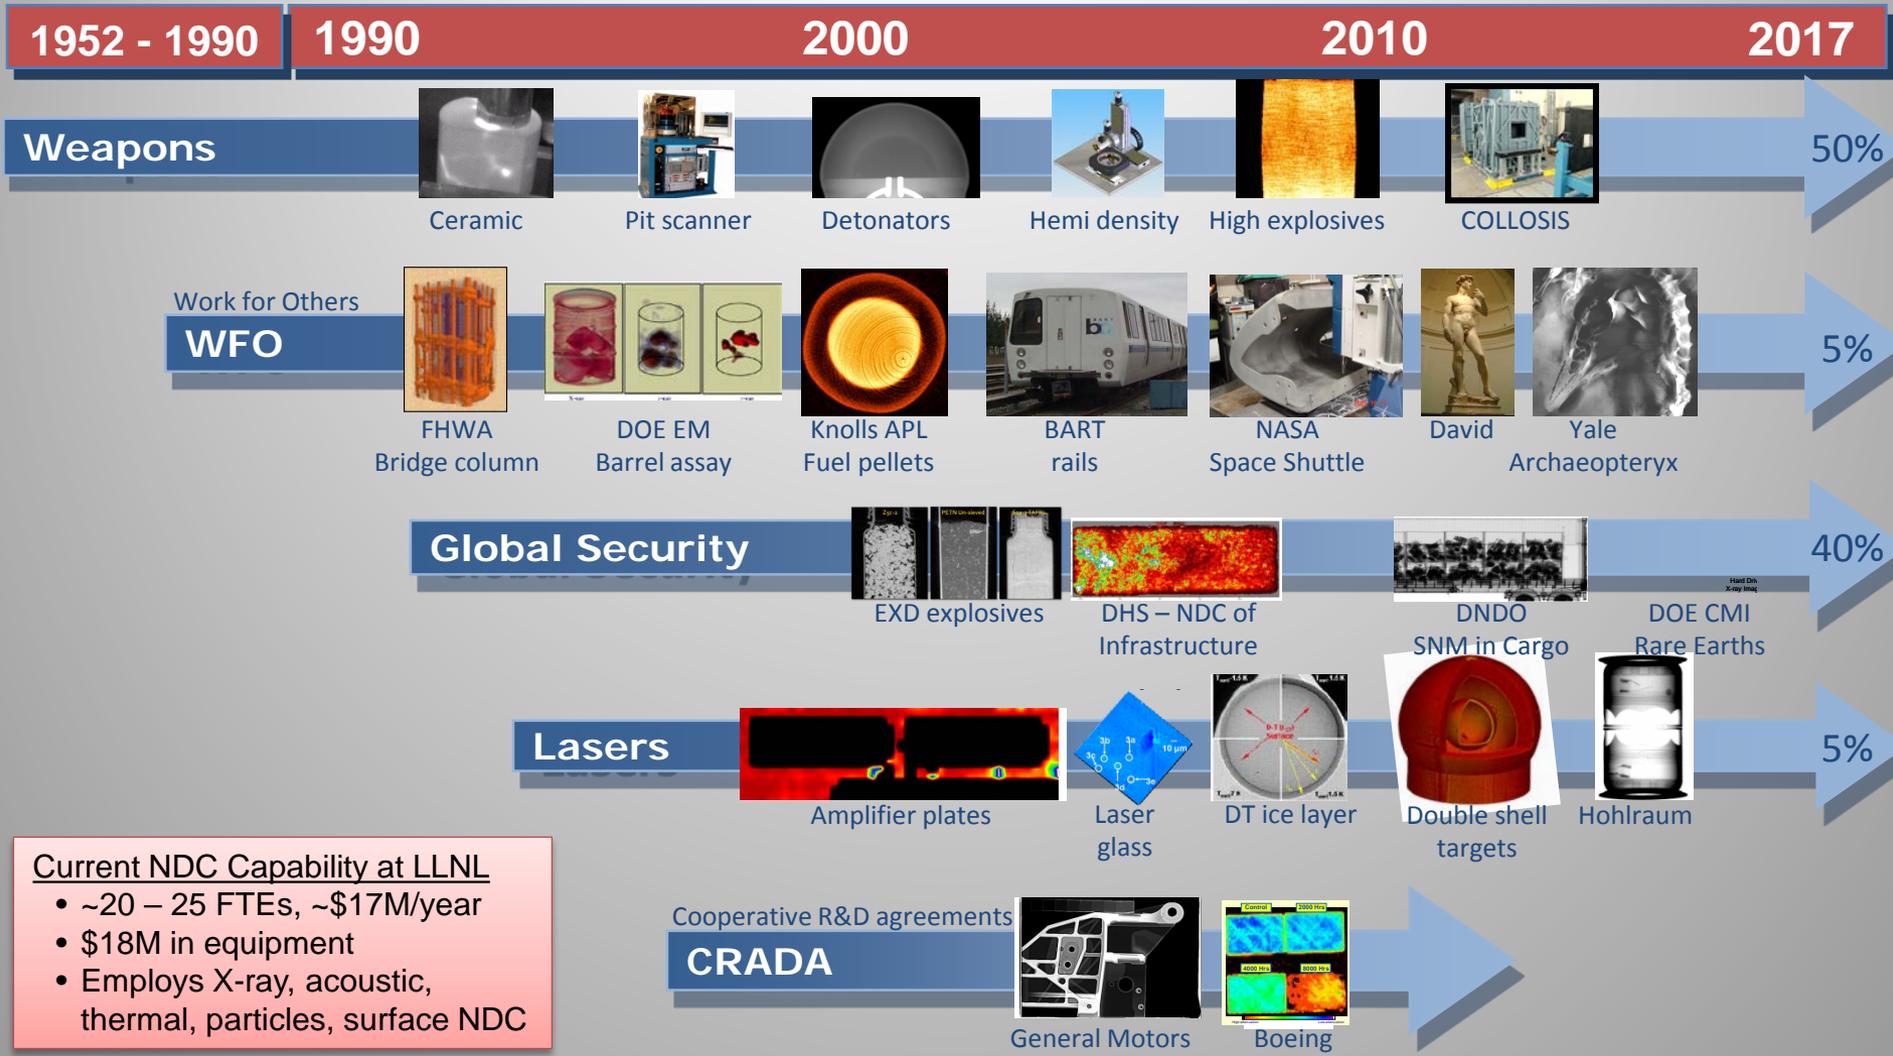

Reports

Reports

Classified

We solve customers' problems using all aspects of NDC.

Born to support nuclear deterrence, our NDC capability helps a broad spectrum of customers

Current NDC Capability at LLNL

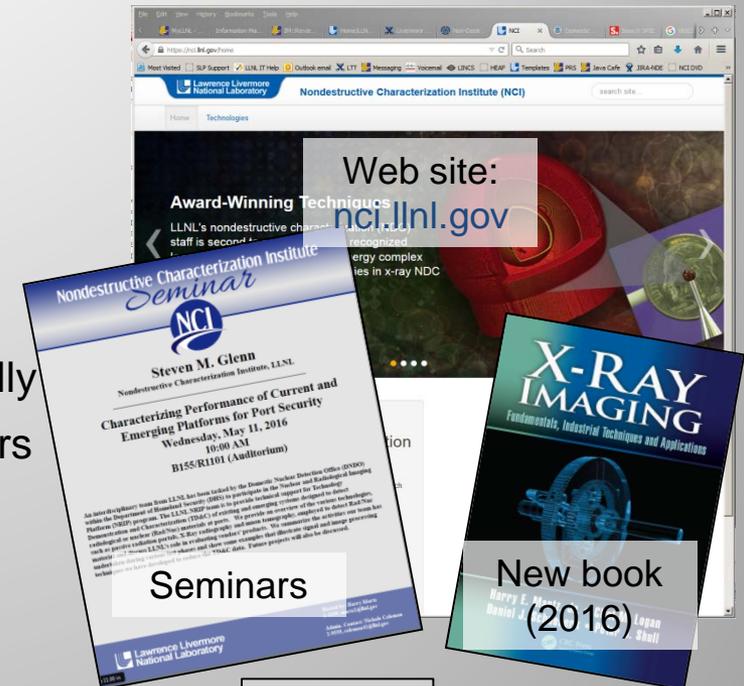

- ~20 – 25 FTEs, ~\$17M/year
- \$18M in equipment
- Employs X-ray, acoustic, thermal, particles, surface NDC

In 2015, LLNL officially formed the

Nondestructive Characterization Institute

- Recognized for an international level of R&D excellence in NDC
- Institutional to LLNL with outreach to academia, government labs, industry
- Promotes NDC advances and competency
 - R&D collaborations with academia, labs, industry
 - Support programs at LLNL, the US and internationally
 - Host and attend conferences, workshops, visits, tours
 - Develop a pipeline to attract and retain world-class talent

Visiting Professor

Former Post-Docs (now FTEs)

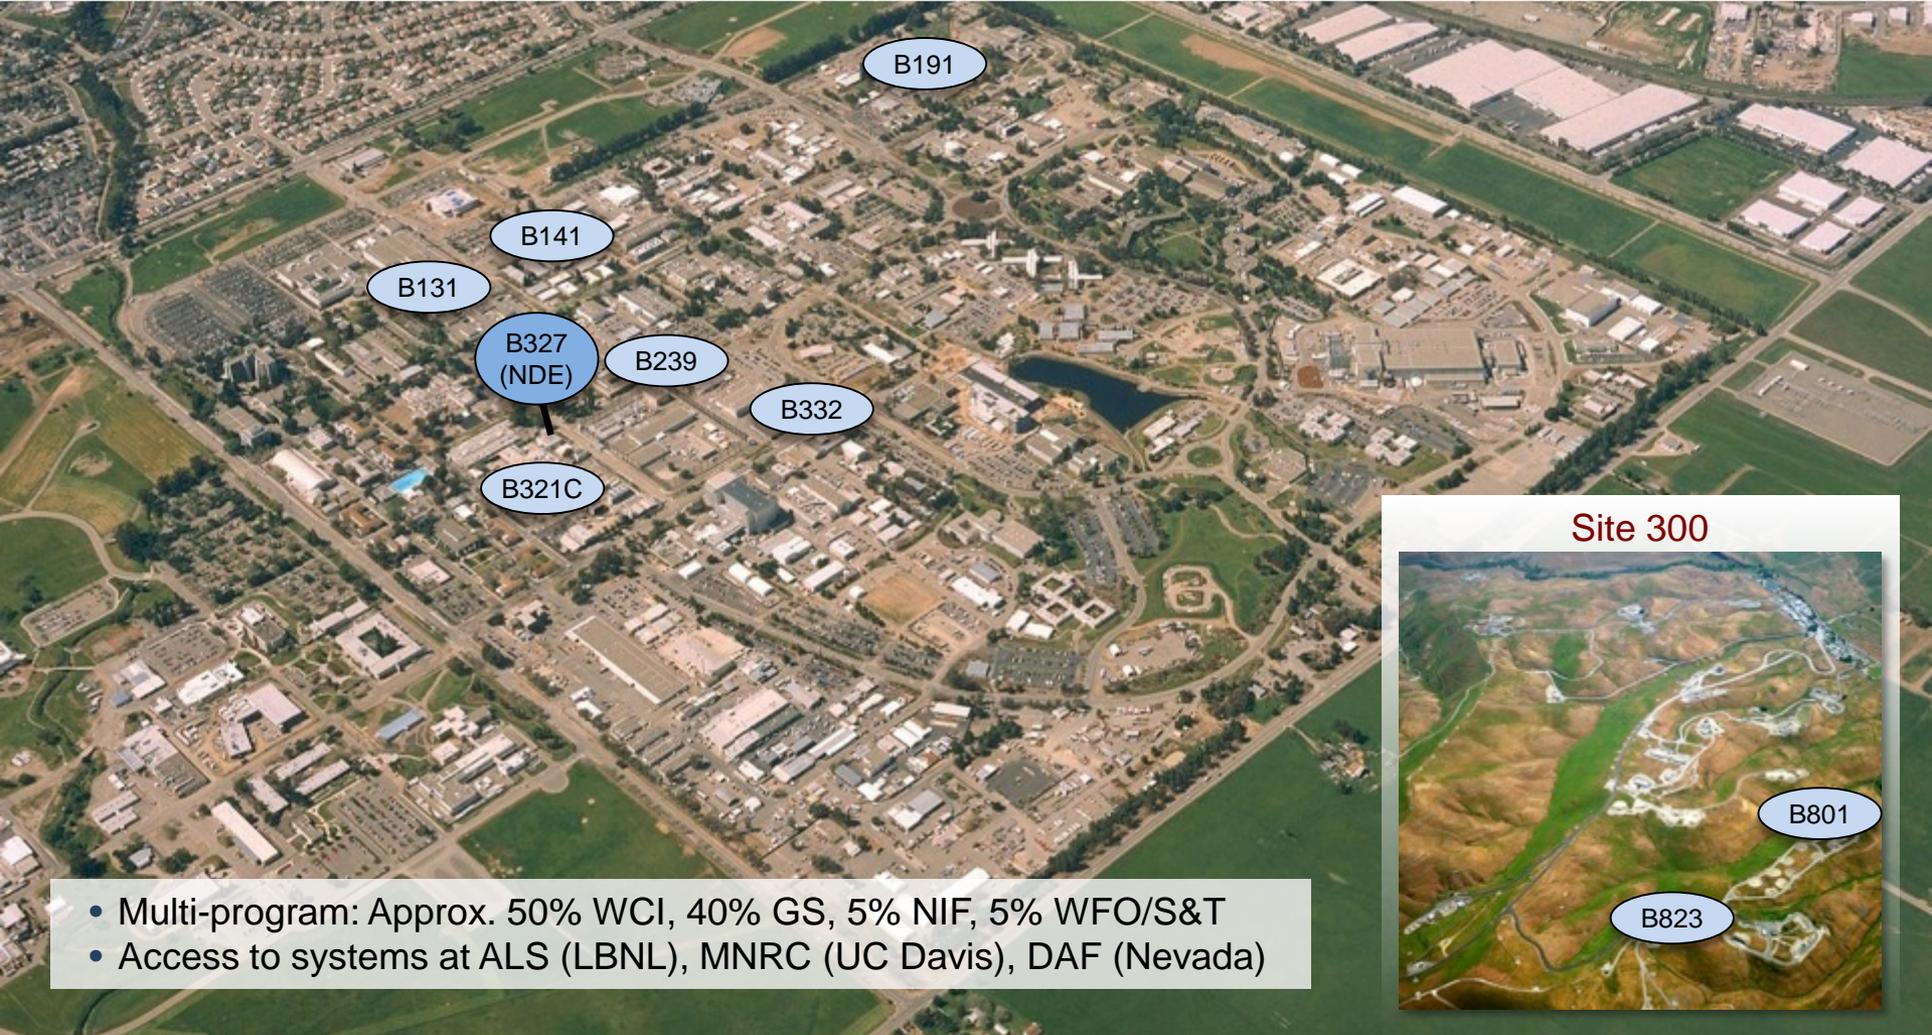

Post-Docs

Ph.D. candidate

Summer interns

LLNL's NDC capabilities are distributed

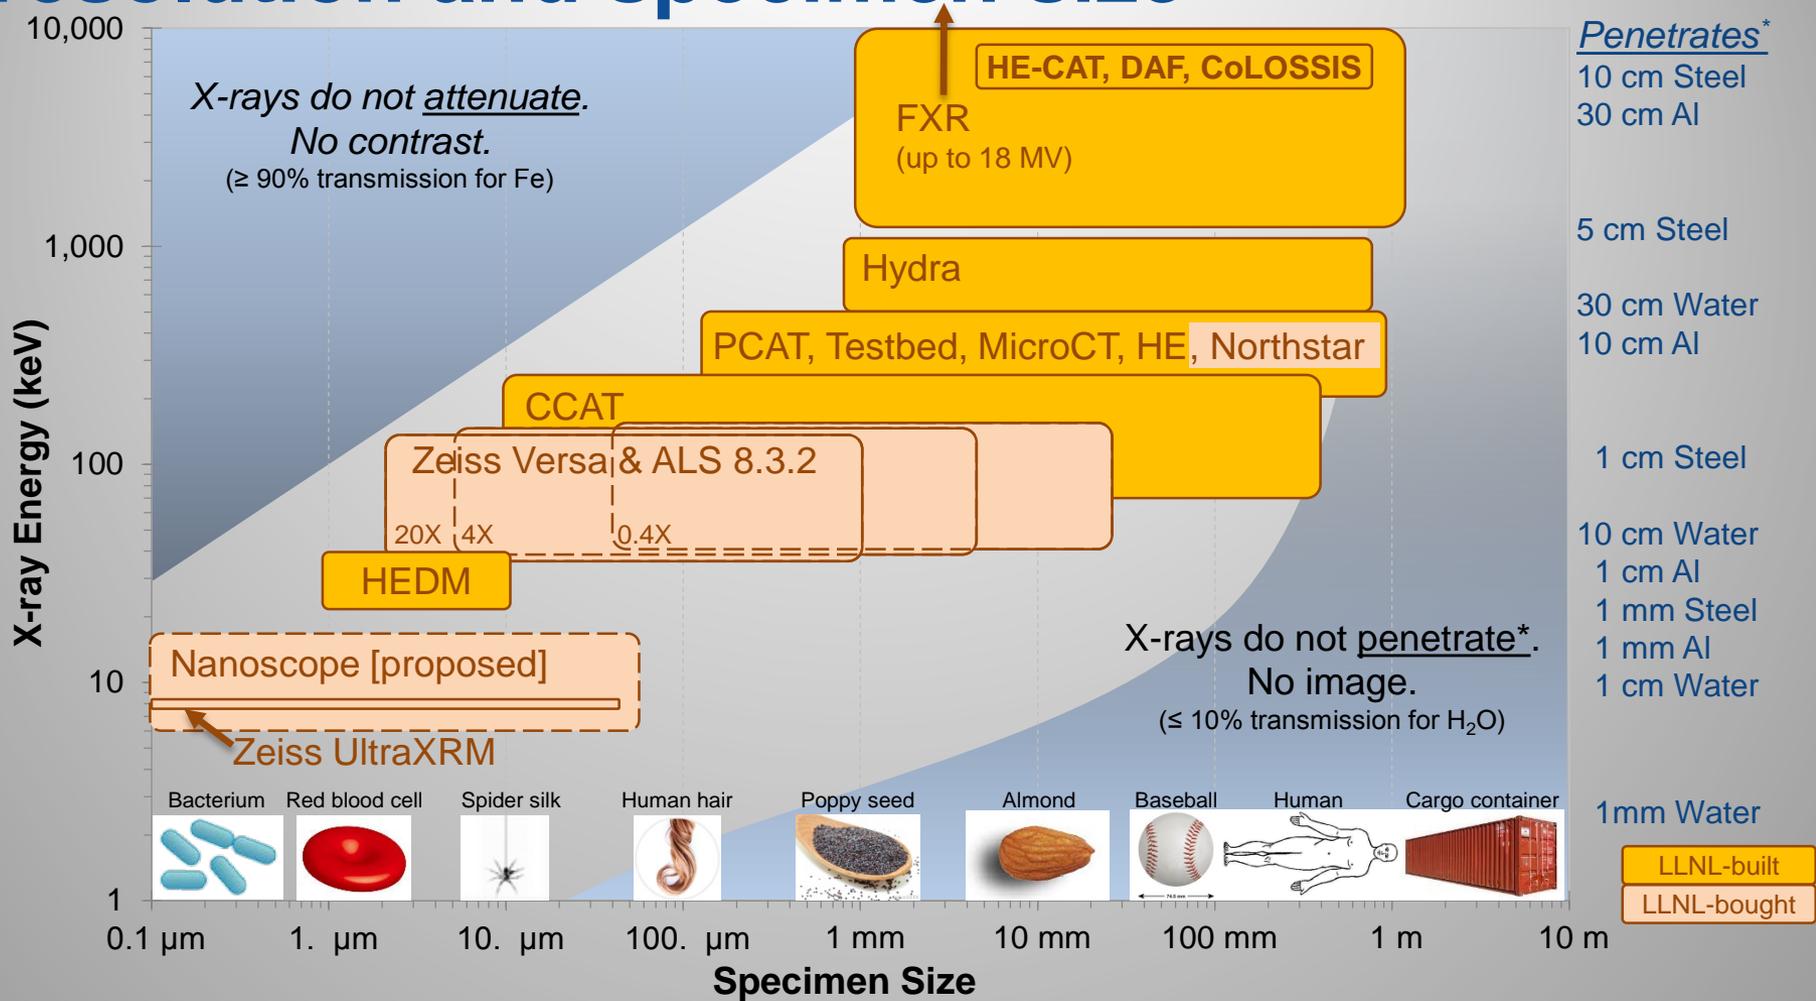

- Multi-program: Approx. 50% WCI, 40% GS, 5% NIF, 5% WFO/S&T
- Access to systems at ALS (LBNL), MNRC (UC Davis), DAF (Nevada)

We have delivered systems worldwide: TRMG (FL), TSL (NJ), Pantex (TX), ALS, Israel, U. Bologna

LLNL X-ray Imaging and CT systems span resolution and specimen size

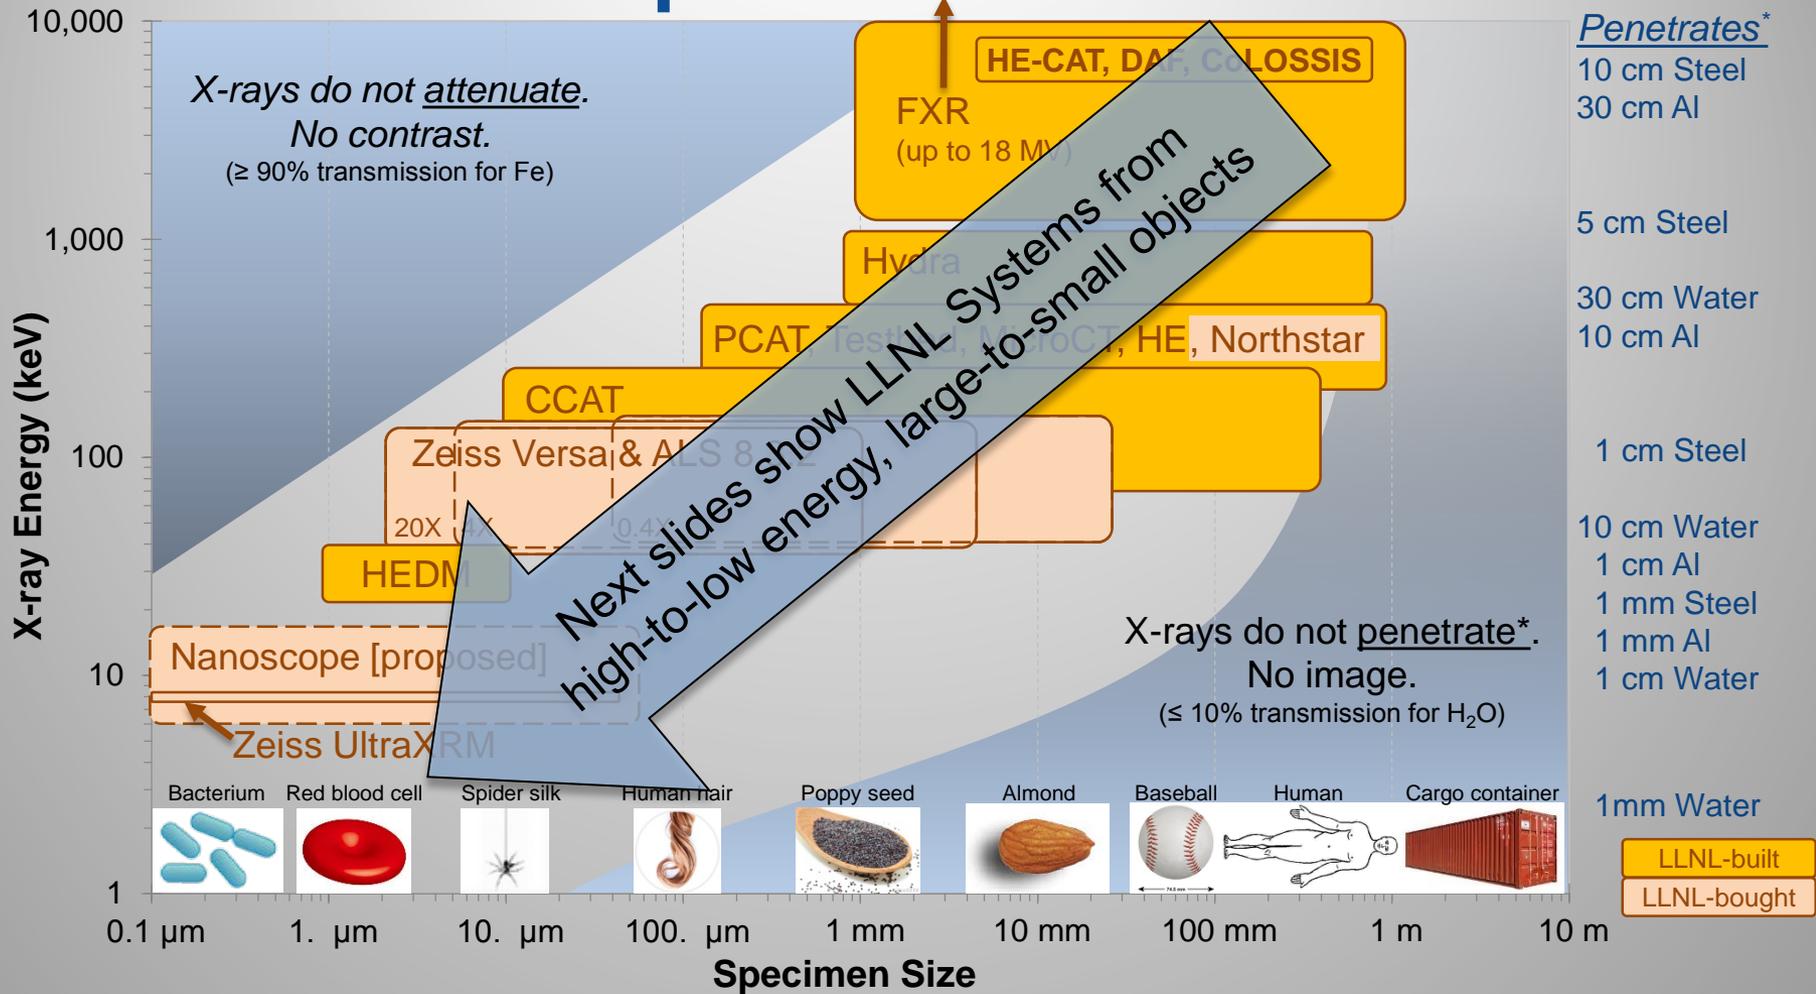

* Penetration is defined as $\mu L \sim 2-3$ for attenuation coefficient μ and material path length L .

LLNL X-ray Imaging and CT systems span resolution and specimen size

LLNL systems are designed for accurate characterization of objects, not for speed/production.

LLNL X-ray Imaging and CT systems span resolution and specimen size

* Penetration is defined as $\mu L \sim 2-3$ for attenuation coefficient μ and material path length L .

Flash X-ray (FXR) radiographs dense hydrodynamic events

Description

- High-speed Radiography of explosions in the Contained Firing Facility (CFF); no CT capability
- One 18-MV linac source, and up to 12 co-timed 450-kV flashes
- CFF rated to 60 kg of high-explosives (HE)

System

- FXR Source – 18-MV linear induction accelerator with tantalum target; 60-ns pulse, 1.6-mm spot size
- Co-timed Sources – 450-kV tubes; 20-ns pulses; ~1-mm spot
- Imagers – Film or image plates (collimated to sources)
- FOV – ~1-m at 10 m with ~500 μm spatial resolution

Location

LLNL Site-300 (East-bay hills) Bunker 801 since the 1980's

Early 450kV image

FXR image

Late 450kV image

Early, middle and late views of an explosively-formed jet, taken through over an inch of attenuating blast protection.

HE-CAT is a high-energy CT system for large, dense objects

Description

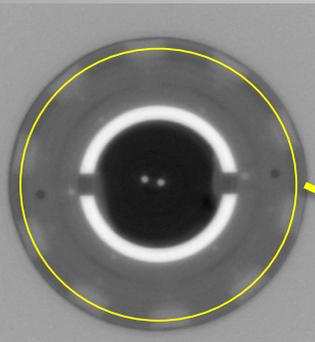

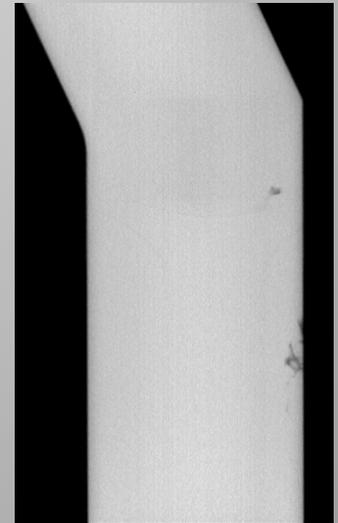

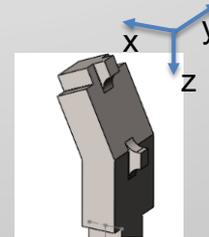

- Flexible high-energy Radiography or CT for many applications, esp. nuclear weapons components
- Able to scan classified parts

System

- Source – Linac 6/9 MV (selectable), ~1-mm spot
- Imager – PE amorphous-Si panel; 200- μm pixel size
- FOV – 40-cm at 6.6-m Src-Det distance

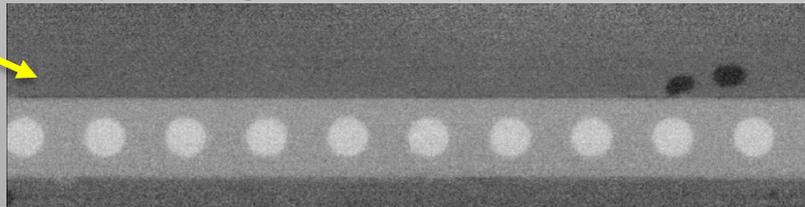

Location

LLNL site, in a buried hi-bay of B239
[an identical system at Site-300 for explosives]

XY-slice

CT of conventional munition aft radial plate (imaged at Site-300)

Annulus Z-slice of boosters

Titanium bow frame

X-Z CT slice

Device Assembly Facility (DAF) has CT capability for nuclear/non-nuclear parts

Description

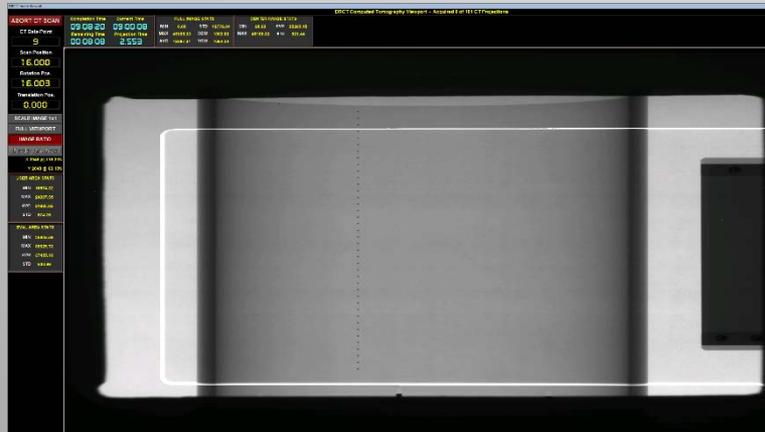

- LLNL-designed imager for product design and evaluation
- LLNL performs radiography & CT imaging/reconstruction
- LANL performs radiography up to 30 lb (14 kg) of HE

System

- Source – Linac 9 MV, ~2-mm spot (soon 15 MV, <1-mm)
- Imager – Film or PE* amorphous-Si panel; 100- μm pixel size
- FOV – 40-cm at 6-m source-detector distance (sdd)

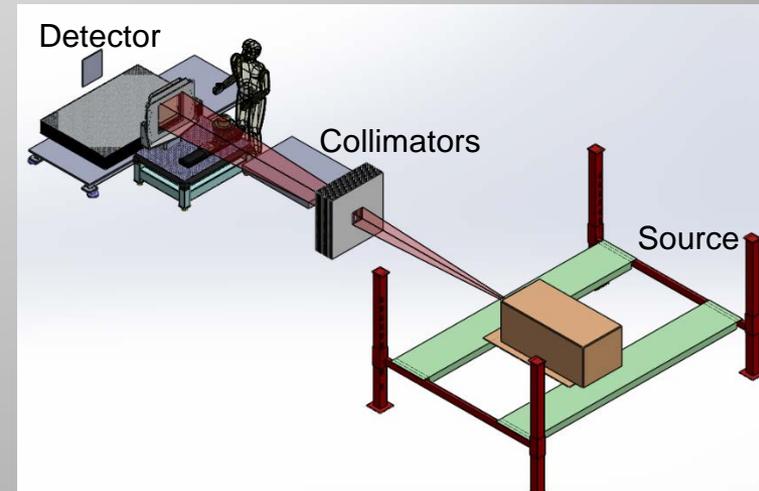

Location

DAF, Nevada Nat'l Security Site

Radiograph of cylindrical test object

* Perkin Elmer

Confined Large Optical Scintillator Screen and Imaging System (CoLOSSIS)

Description

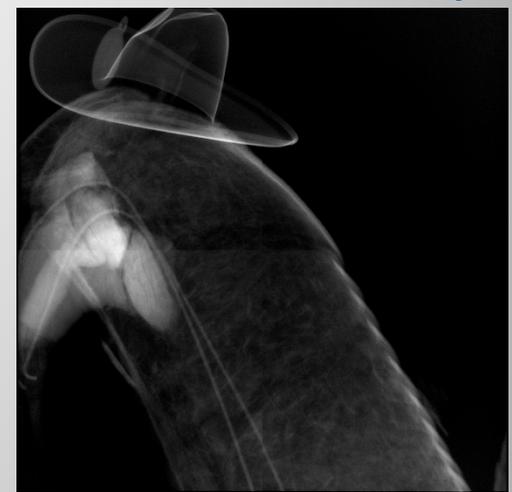

- LLNL-built large-format CT for nuclear weapon components

System

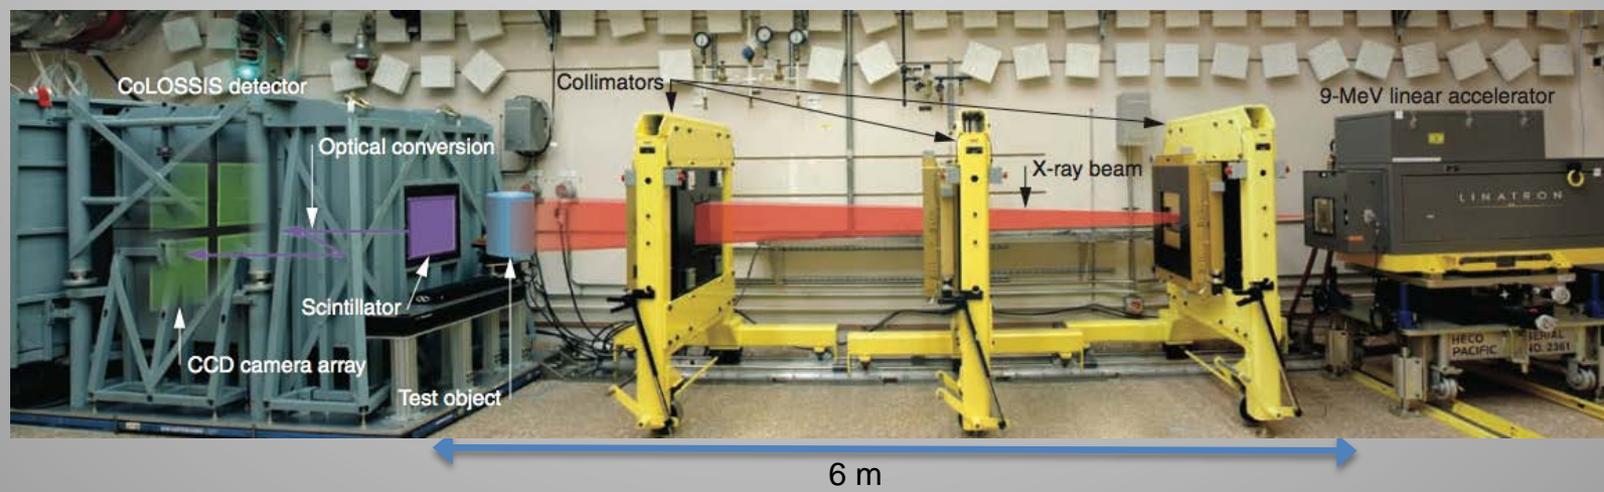

- Source – Linac 6/9 MV, ~1.5-mm spot
- Imager – Scintillator coupled to pyramid-shaped central mirror to four gimbal mirrors to four high-resolution CCD cameras
- FOV – ~23-cm; 30 μ m pixels; v.2 will have 30-cm FOV with LLNL GLO scintillators; 6-m source-detector distance (sdd)

Location

Pantex Plant, Amarillo, TX

Example of four stitched radiographs

Hydra Flash X-ray system can image high-speed explosions

Description

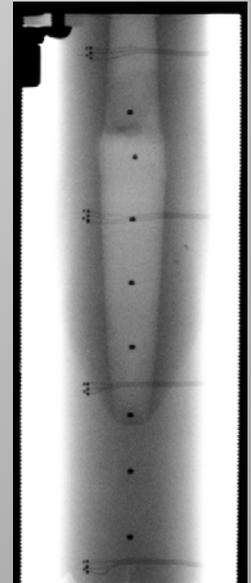

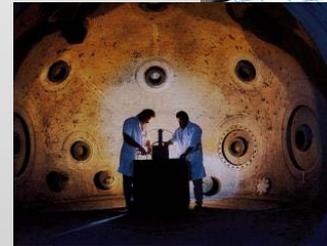

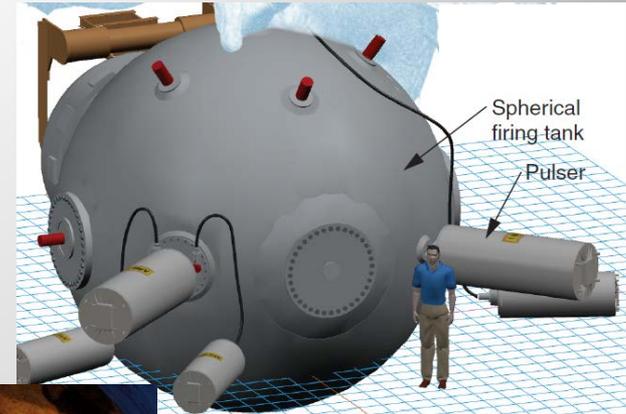

- Multi-channel X-ray imaging of dynamic events with up to four independently-timed 10-ns x-ray flashes
- Can image up to 10-kg of high-explosives (HE) detonating in a 4.9-m-diam tank from different angles

System

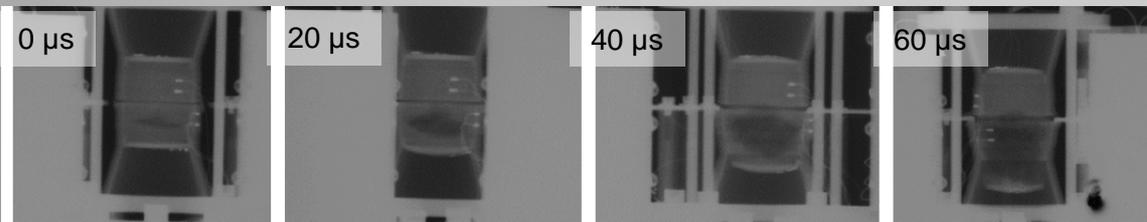

- Source – Two 1-MV and two 450-kV pulsed
- Imager – Film (16-in square); <1-mm spatial res
- FOV – ~30-cm at 6-m source-detector distance

Location

LLNL High-Explosives Application Facility (HEAF)

Deflagration to detonation transition

Time sequence of thermal explosion

PCAT is one of the first CCD-based CT systems

Description

- Flexible lab-based Radiography or CT
- Many applications, esp. nuclear weapons components
- Rated to 125 g of HE; Able to scan classified parts

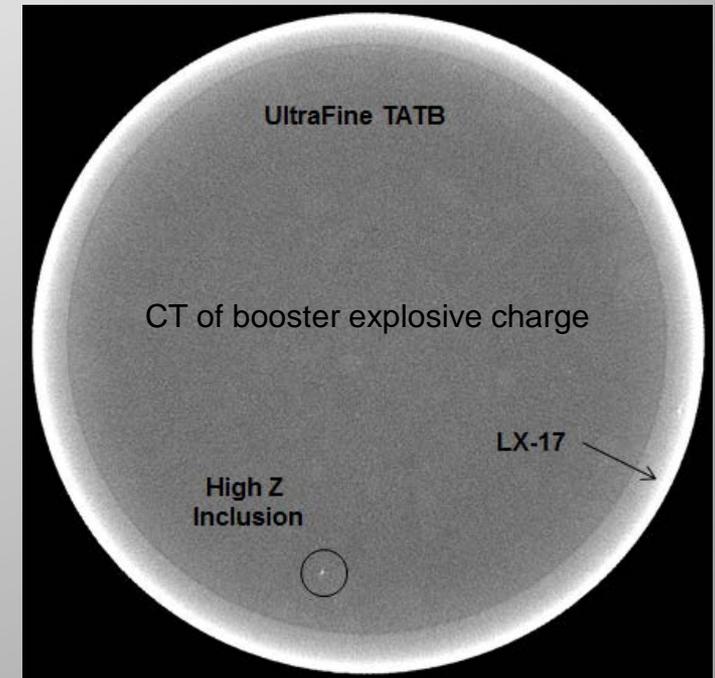

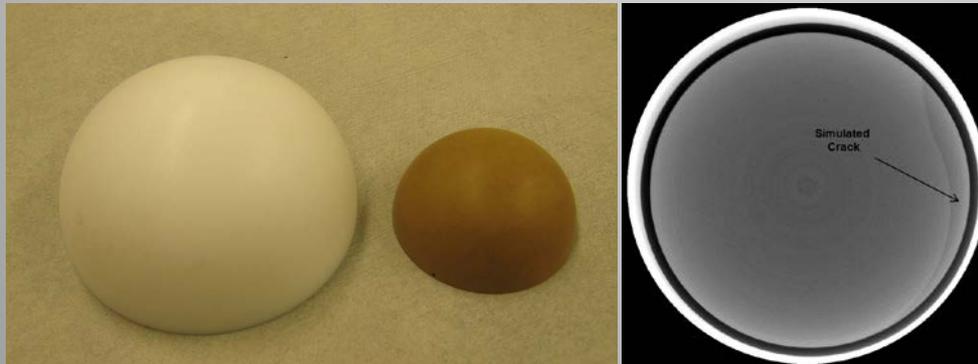

System

- Source – 450-kV tube (Yxlon); 0.4- or 1-mm spot size
- Imager – Scintillator to Cooled-CCD via a turning mirror; 50 to 200- μm pixel size
- FOV – <50-cm; up to 5-m source-detector distance

Location

LLNL site, basement of B327

Teflon and Rulon mock explosive with manufactured crack

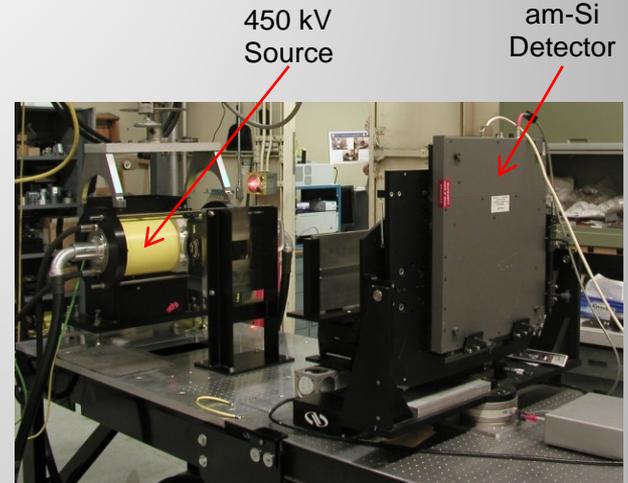

“Micro”CT Test-bed is a reconfigurable and flexible flat-panel system

Description

- Flexible up-to-450-kV Radiography or CT for many applications, esp. nuclear weapons components
- Used to test hardware and software configurations
- Rated to 125 g of HE; Able to scan classified parts

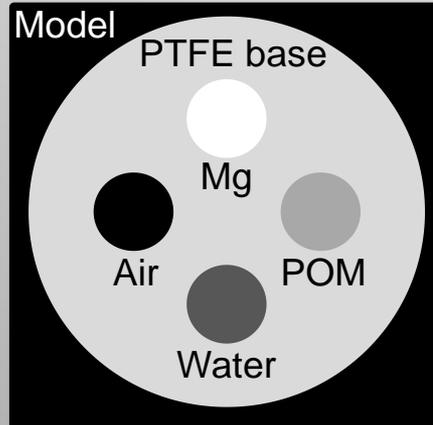

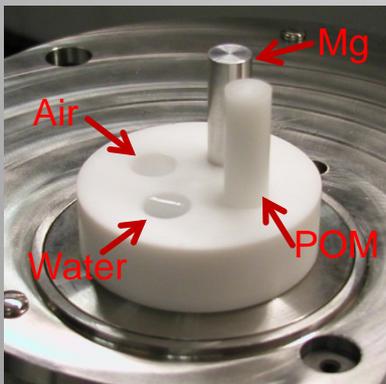

System

- Source – 450-kV tube (Yxlon); 0.4 or 1-mm spot size
- Imager – PE amorphous-Si (am-Si) panel; 200- μ m pixel size
- FOV – 40x40 cm²; <3-m source-detector distance

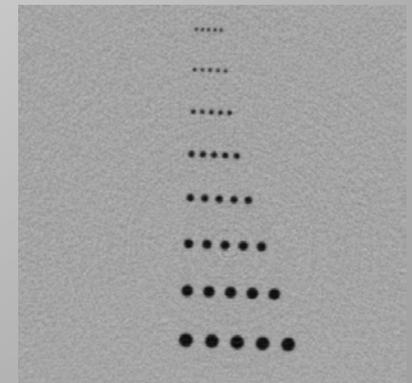

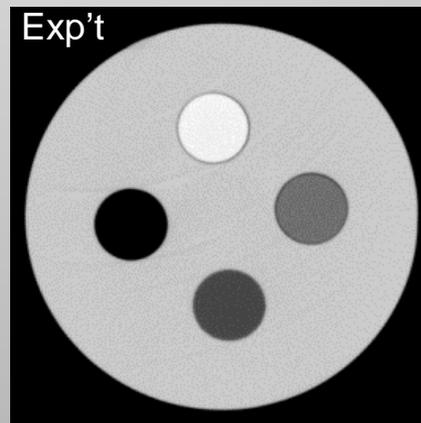

Location

LLNL site, basement of B327

Calibrated test object

Medical Phantom

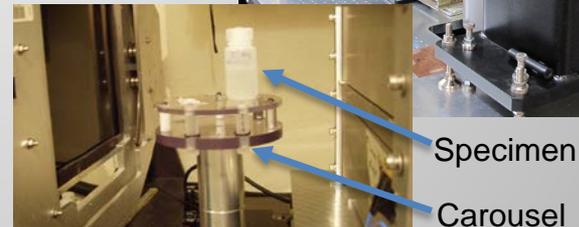

“Micro”CT HEAF systems characterize homemade explosives (HMEs) for DHS

Description

- Accurate and QA-controlled production CT for explosives characterization (small quantities) over many years
- Four similar systems at LLNL, TSL*, TRMG†, and Israel
- Each different HME is cross-measured, used for Cert

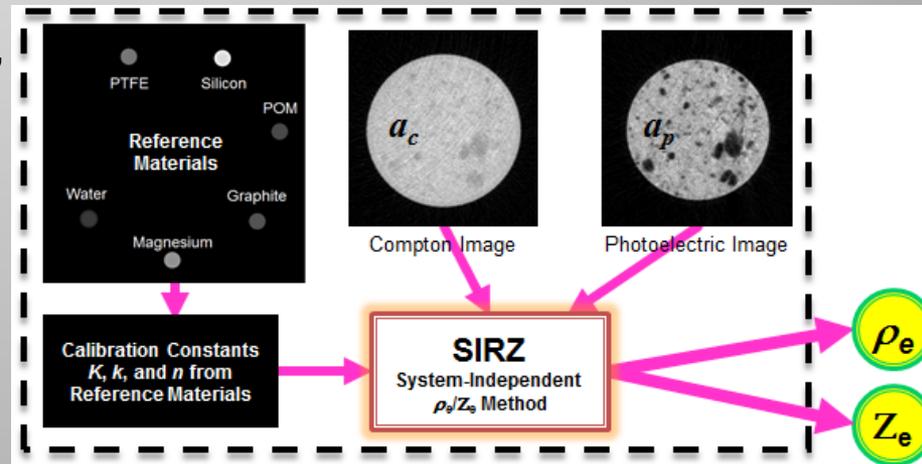

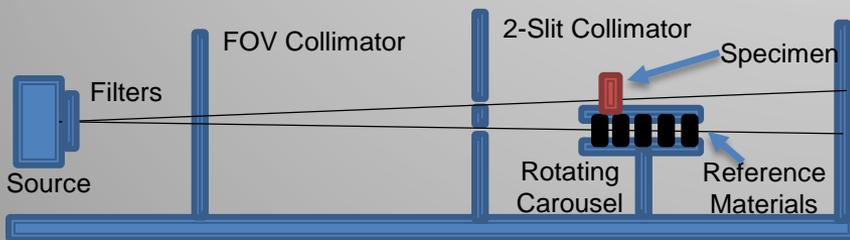

System

- Source – 450-kV tube (Yxlon); 0.5- to 2-mm spot size
- Imager – PE amorphous-Si panel; 200- μ m pixel size
- FOV – 40-cm at ~1-m source-detector distance
- 11x mag without geometric unsharpness

Location

Production systems in LLNL (HEAF building), New Jersey, Florida and Israel

* Transportation Security Laboratory, New Jersey

† Tyndall Reactive Materials Group, Tyndall AFB, Florida

A Leidos CT80-DR checked-bag scanner is installed in HEAF for TSA

Description

- Production Expl. Det. System (EDS), same as in airports, used to characterize home-made explosives (HMEs)
- Dual-energy CT capability; LLNL access to raw data
- Remote HME mixing and handling allows for safe testing
- Room rated to 1 kg of HE

System

- Source – 160-kV tube;
- Imager – Dual-row; ~1 mm in plane pixel size
- FOV – ~160-cm bore

Location

LLNL High-Explosives Application Facility (HEAF)

LEXI robot can deliver explosive material from LabRam to shot stand

This EDS is the same as in airports and serviced by Leidos through TSA contract
<https://www.leidos.com/products/security/reveal-ct-80dr>

Remote HME Delivery and Purification

HEAF-CAT is for production imaging of weapons and explosives

Description

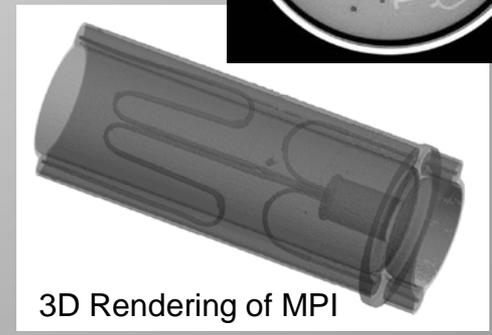

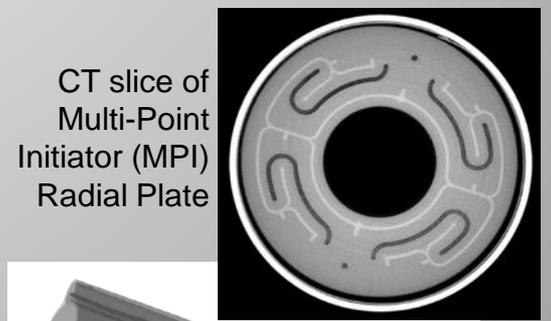

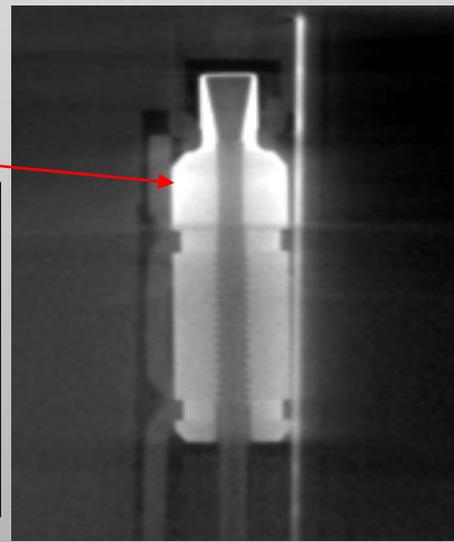

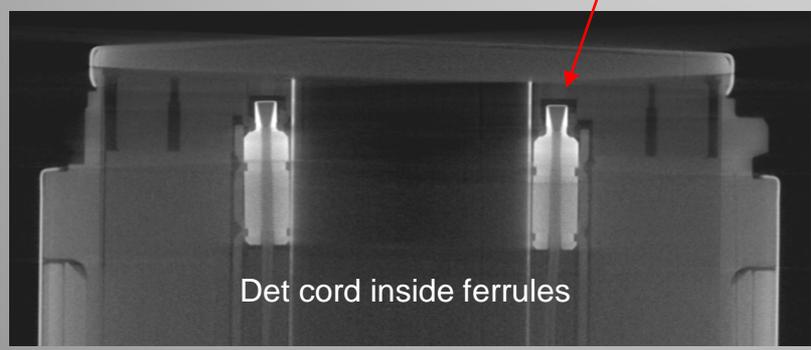

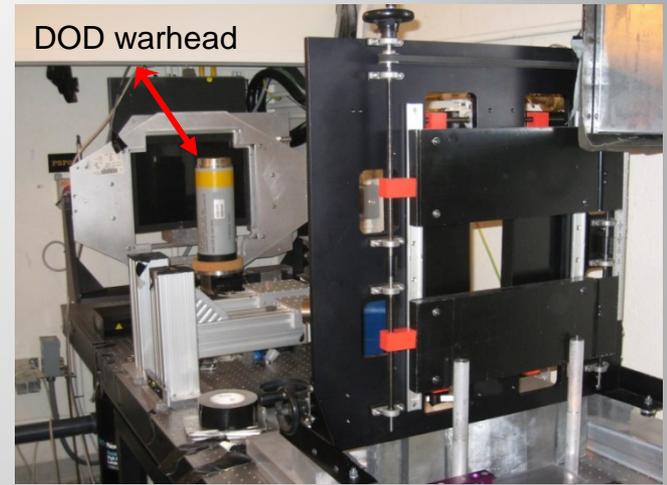

- Modified MicroCT for weapons, munitions and explosives in HEAF
- Rated to 10 kg of HE; Able to scan classified parts

System

- Source – 450-kV tube (Yxlon); 0.5- to 2-mm spot size
- Imager – PE amorphous-Si panel; 200- μ m pixel size
- FOV – 40-cm at ~1-m Src-Det distance

Location

LLNL High-Explosives Application Facility (HEAF)

Recently-purchased North Star Imaging system images explosives

Description

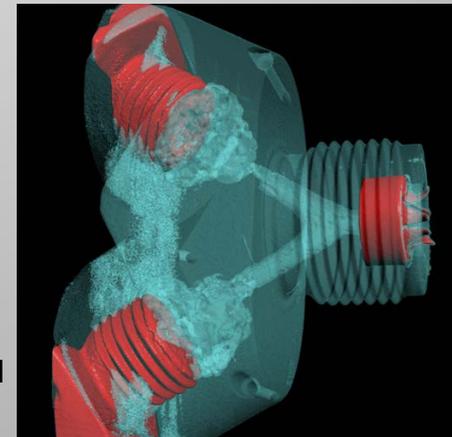

- NSI X25 is a flexible commercial system for many Radiography or CT applications (e.g., explosives)
- Reduces the workload on other HEAF systems
- Room rated to 10 kg of HE;

System

- Source – 160 kV tube; $\sim 0.5\text{-}\mu\text{m}$ spot
- Imager – Flat-panel or linear detector array
- FOV – $\sim 180\text{-cm}$ at $<1\text{-m}$ source-detector distance

Location

LLNL High-Explosives Application Facility (HEAF)

Courtesy NSI

An example of rapid response – X-ray Imaging for Rare-earth Recovery

Description

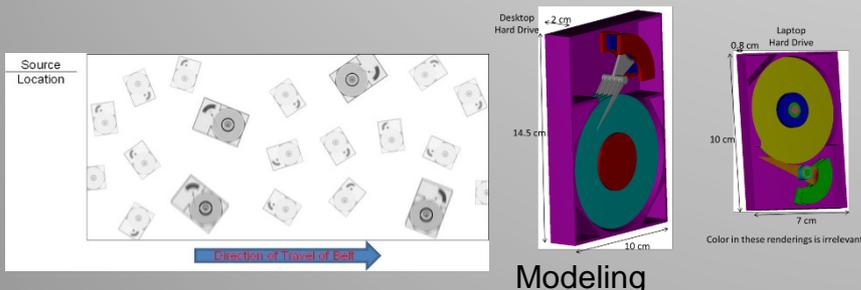

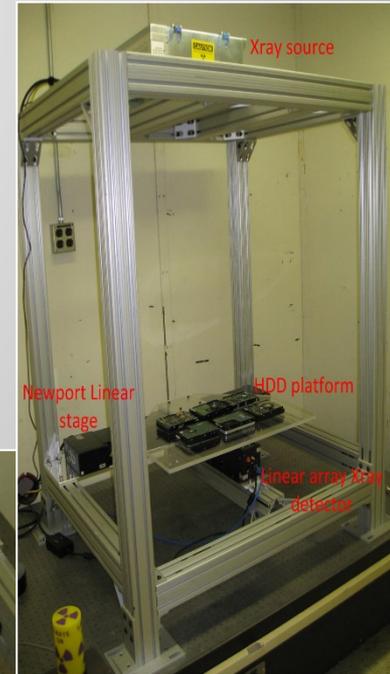

- We quickly modified an existing x-ray chamber for DOE's Critical Materials Institute (CMI) to scan hard-disk drives (HDDs)
- Feasibility study for conveyer-belt scanner to find rare-earths
- Achieved throughput of 248 HDD/hour for an Oak Ridge extraction system

System

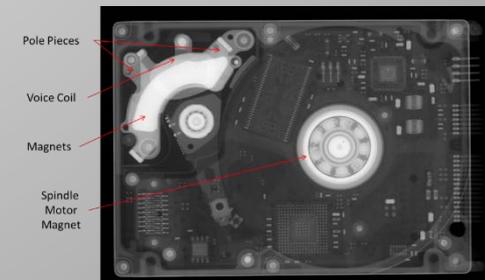

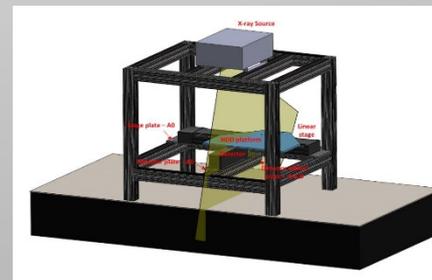

- Source – 80-160-kV tube source (200 W)
- Imager – Linear 3072-element array; 0.1-mm pixel size; frame rate of 1500 Hz
- FOV – 30-cm fan-beam; $\sim 250\text{-}\mu\text{m}$ spatial resolution
- Linear stage moved at 5 mm/sec

Location

LLNL site, basement of B327

Modeling

Hard-disk drives contain rare-earth magnets for re-use and recycling.

CCAT* provides high magnification using a micro-focus source

Description

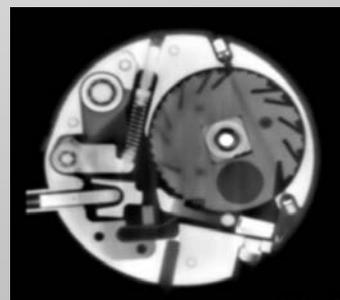

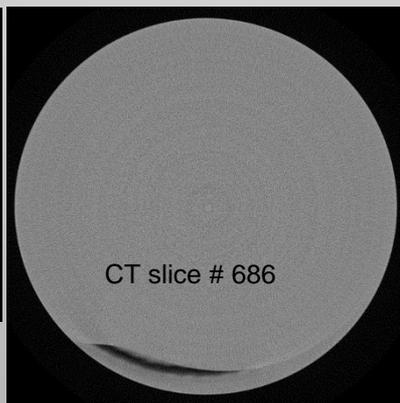

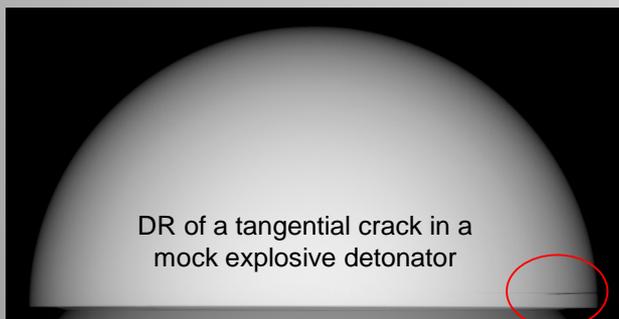

- Flexible FeinFocus Radiography or CT with up to 20x mag
- Many applications, esp. nuclear weapons components
- Rated to 20 g of HE; Able to scan classified parts

System

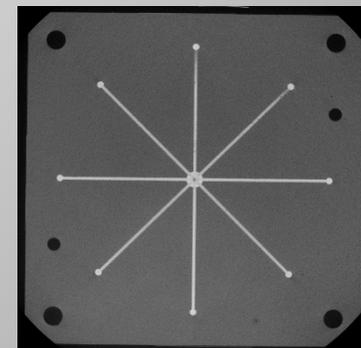

- Source – 125- to 225-kV FeinFocus tube; 10- μ m spot
- Imager – PE** amorphous-Si panel; 100- μ m pixel size
- FOV – 2- to 40-cm; 20- to 400- μ m spatial resolution
- ~1-m source-detector distance; 1.25x to 20x mag

Location

LLNL site, sub-basement of B327

ZEISS Xradia 510 Versa provides micro-scale imaging in the lab

Description

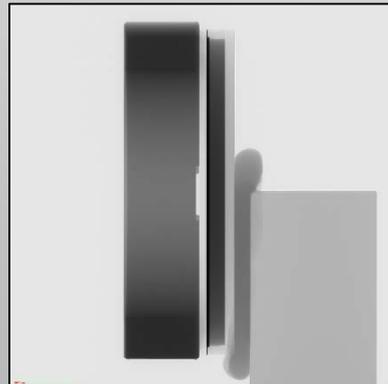

- Micro-scale ZEISS Xradia 510 Versa for intermediate sizes
- Flexible Radiography or CT for many applications
- Room rated to 10 mg of HE; Able to scan classified parts

System

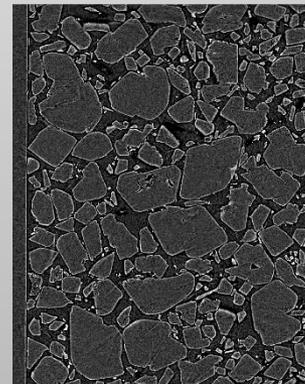

- Source – Nordson Dage microfocus (30 – 160 kV); 3- μ m spot
- Imager – CCD optically-coupled scintillator with 0.4 to 20x magnification; 20- to .5- μ m pixels
- FOV – 1- to 50-mm at ~1-m source-detector distance
- 0.9- to 20- μ m spatial resolution

Location

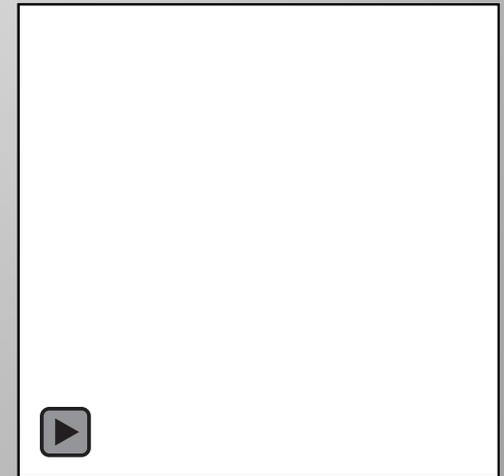

LLNL site, B321C

* National Ignition Facility, LLNL

LLNL has installed an x-ray imaging system at the Advanced Light Source (ALS)

Description

- Built under an LLNL/ALS collaboration
- Now operated by ALS as open access beamline

System

- Source – ALS Synchrotron; 8.3.2; 8 – 46 keV
- Imager – Choice CdWO₄, LuAG, GGG, Yag:Ce scintillator to PCO.4000 CCD; 0.32- to 7.2- μ m pixels; ~1.5 cm to 1.5 m sample-to-detector distance
- FOV – 1.8 - to 40 mm;

Beamline 8.3.2 hutch

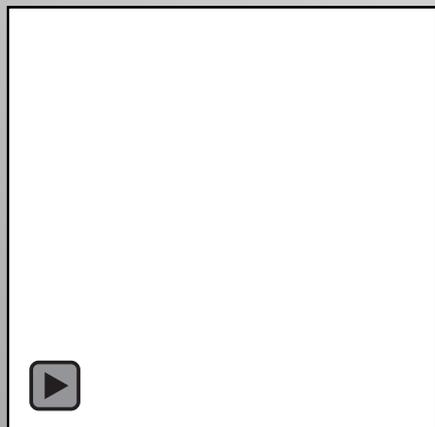

Micro-tomography camera

Location

Advanced Light Source (ALS), LBNL, Berkeley, CA

ZEISS Xradia UltraXRM provides nano-scale imaging in the lab

Description

- Xradia UltraXRM-L200 nanoscale radiography system
- Flexible Radiography, CT and phase-contrast imaging
- Rated to 10 mg of HE; Able to scan classified parts

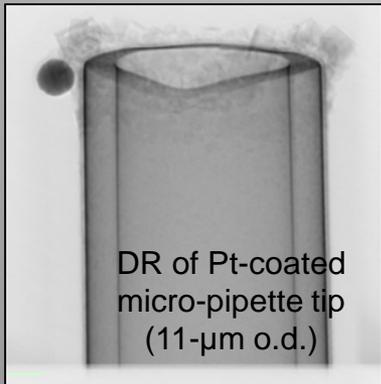

System

- Source – Rigaku MicroMax™-007 HF; 8.04 kV (quasi-monoenergetic); near-parallel beam
- Imager – Princeton Instruments Pixis CCD camera; 200x and 800x mag; 50- to 200-nm spatial res
- FOV – 16- to 65- μm

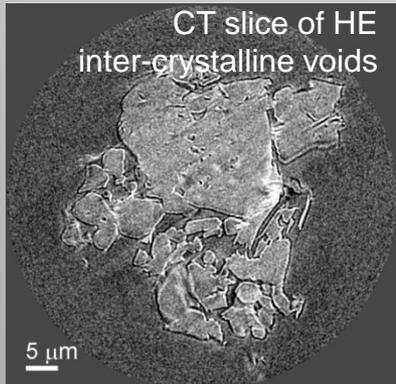

Location

LLNL site, in a buried hi-bay of B327

3D rendered polystyrene beads [MOVIE] (720-nm dia.)

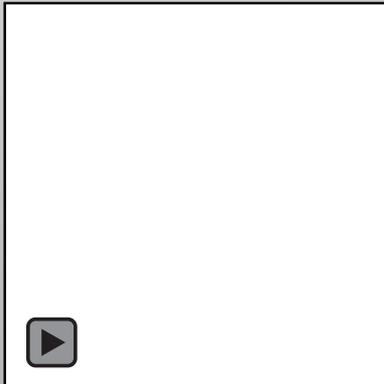

DR of Pt-coated micro-pipette tip (11- μm o.d.)

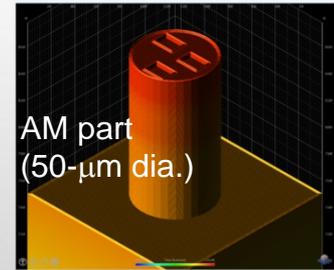

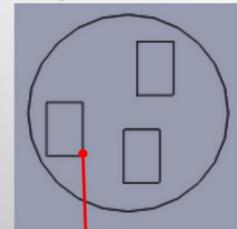

CT slice of HE inter-crystalline voids

5 μm

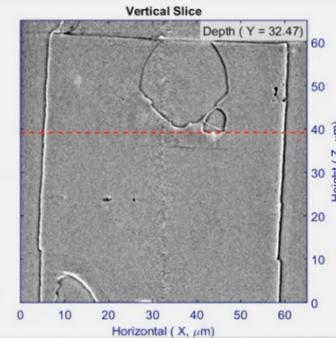

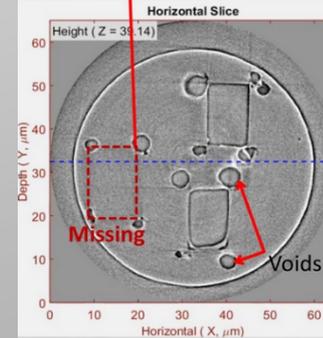

As Designed

AM part (50- μm dia.)

As Built

High-Energy Diffraction Microscopy (HEDM) for crystal surface studies

Description

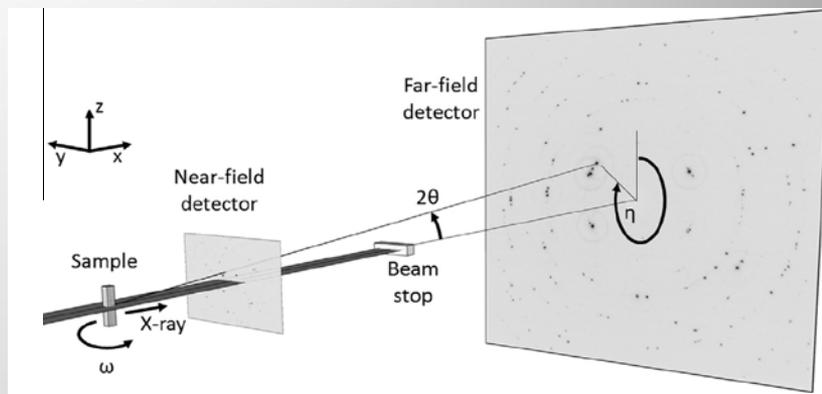

- Transportable X-ray diffraction system for polycrystalline materials
- Two modes
 - Near-field for spatial res (5-15 mm SDD*) yields lattice orientation, grain boundaries, defect structure
 - Far-field for angular res (0.2-2 m sdd*) yields orientation, strain/stress, centroids

System

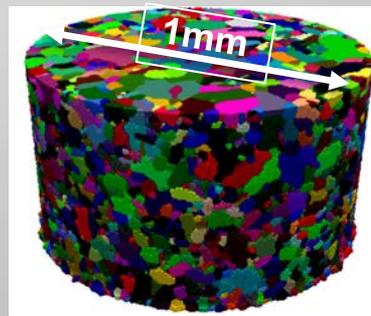

- Source – Synchrotron (52-91 kV); varying beam sizes of 1.5-mm by either 0.002- or 1.0-mm
- Imager – PE amorphous-Si panel; 200- μ m pixel size; continuous integration over a rotation interval (typ. 0.25°)
- FOV – \sim 1-mm

Location

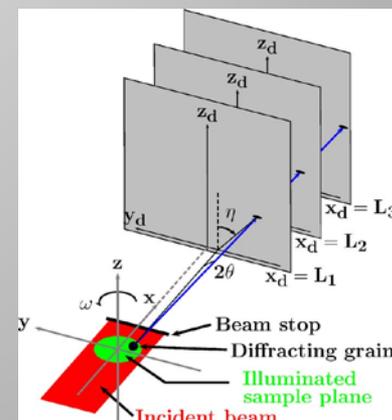

ALS Berkeley or APS Argonne
[lab source under development]

Near- and Far-field – Simultaneous measurement showing typical image data for a polycrystalline sample

Reconstructed 1-mm³ nickel sample with several thousand grains, where color indicates lattice orientation

Near-field – Schematic w/ three detector locations

* Source-to-detector distance

Nanoscope proposed to be installed for chip assurance

Description

- Purchased by DARPA-TRUST program at LLNL
- Needs light-source in 8- to 12-keV range
- May be able to scan classified parts

System

- Source – ALS or Lyncean compact light source; 8- to 35-keV (chip assurance at 9 keV)
- Imager – Retiga 2k x 2k CCD camera; 7.4 μm pixels
- FOV – 40 μm; 20-nm pixels

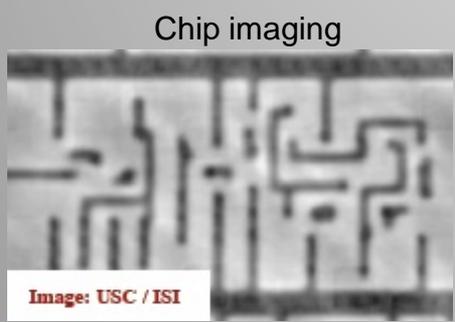

Location

LLNL site; In storage until source is identified

LLNL's DRCT code provides flexible data acquisition for x-ray radiography and CT

Setup Parameters (DR or CT, etc.)

- Emphasizes scan repeatability, efficiency and image quality
- Flexible scan geometries, equipment and methods
- Wide range of equipment (sources, detectors, and motion control)
- Embedded QA features (e.g., logging source temperature, spectrum, intensity fluctuations...)

The screenshot displays the DRCT software interface, divided into several sections:

- Top Panel:** Contains buttons for 'Exit DRCT', 'Run ImageRec', 'Run Panel Align', 'Save DRCT Setup', 'Load DRCT Setup', and 'Load DRCT ROI'.
- Facility and Source:** Shows 'NDE Facility' (LLNL_B327_TEST_BED) and 'X-RAY Source' (YXLON_450kV).
- X-RAY SOURCE SETTINGS:** Includes fields for Energy (45.00 kV), Current (2.50), Spot Size (0.4 mm), and Flux Level (5.0 %).
- X-RAY SOURCE FILTER:** Shows settings for X-Ray Filter 1, 2, and 3, all set to 'None'.
- EXPOSURE INTEGRATION:** Includes 'Integ. Time' (0.100 sec), 'Panel Gain (pF)' (0.50 pF (High)), and '2048x2048@0.2mm'.
- X-RAY SOURCE / DETECTOR POSITION:** Shows 'Src-Obj-Dist' (5591.00 mm), 'Obj-Det-Dist' (519.00 mm), 'Src-Det-Dist' (6110.00 mm), and 'Magnification' (1.0928).
- CT SCAN AREA:** Includes 'Angular Range' (360.00 deg), 'Projections' (90), 'Plus 1' (OFF), and 'Proj. Index' (4,000).
- SYSTEM STATUS:** Shows 'Motion' (Disabled), 'PerkinElmer' (Disabled), 'Calibraion' (Error), 'Temperature' (ERROR), and 'Storage' (C:) 720.90 Gb.
- Right Panel (Setup Parameters):** Contains buttons for 'DC Full Panel', 'DR Full Panel', 'CT SCAN Full Panel', 'DRCT Simulation', and 'Stop Process'. It also includes fields for 'Login ID' (skeate2), 'User ID' (UNDEFINED), 'Filename' (BallPham), 'Part ID' (BallPham), and 'Data Dir.' (C:\TestData).

System Status

Scan data processing

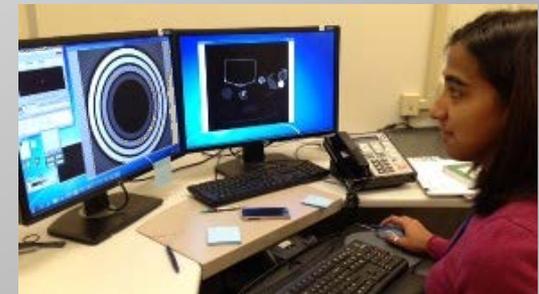

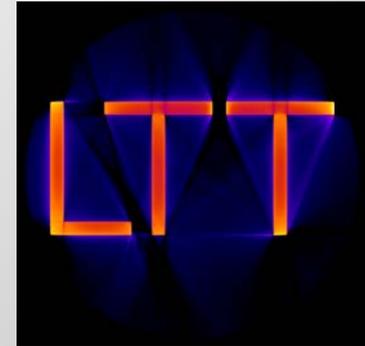

Livermore Tomography Tools (LTT) contain powerful CT processing codes

■ State-of-the-art Algorithms for CT

- **20X speedup** over previous software (large cost savings or expanded throughput)
- **2.5X improvement** in contrast- and signal-to-noise ratios (statistical CT algorithms)
- Includes many state-of-the-art and novel algorithms (e.g., SIRZ)
- Supports parallel-, fan-, & cone-beam geometries, and modern fixed-gantry
- Produces quantitatively-accurate results (with units) in a timely manner
- Contains extensive modeling capabilities

■ State-of-the-art Code Features

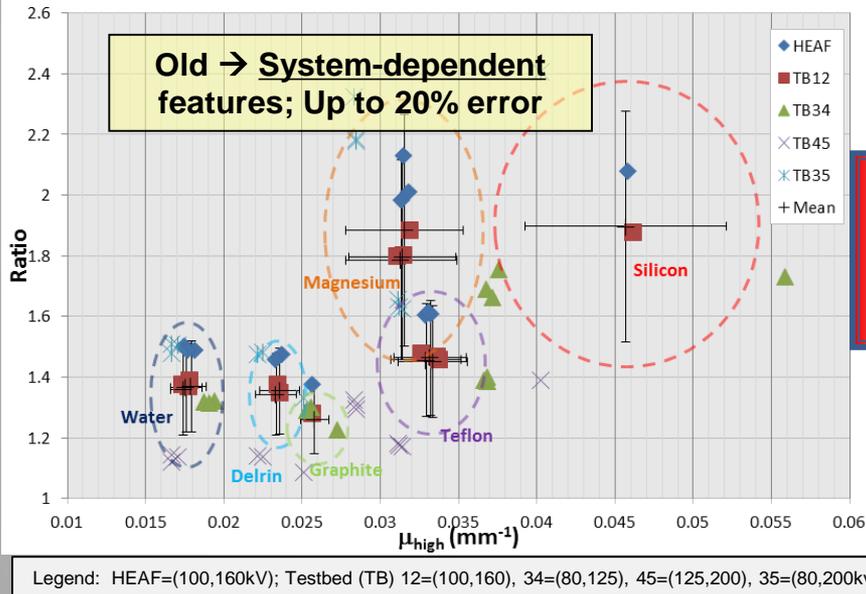

- Cross-platform (Windows, Mac, Linux) written entirely in C/C++
- Multi-threaded (OpenMP) and utilizes GPU processing (OpenCL)
- Standard file format that converts to/from DICOM, DICOS, DICONDE and others
- Data sets that are too large to fit into memory are processed in smaller chunks
- Connects smoothly with LLNL's DR/CT acquisition software
- Processes CT data from raw detector counts to reconstructed images and beyond

System-independent (ρ_e , Z_e) method (SIRZ*) makes dual-energy CT more quantitative

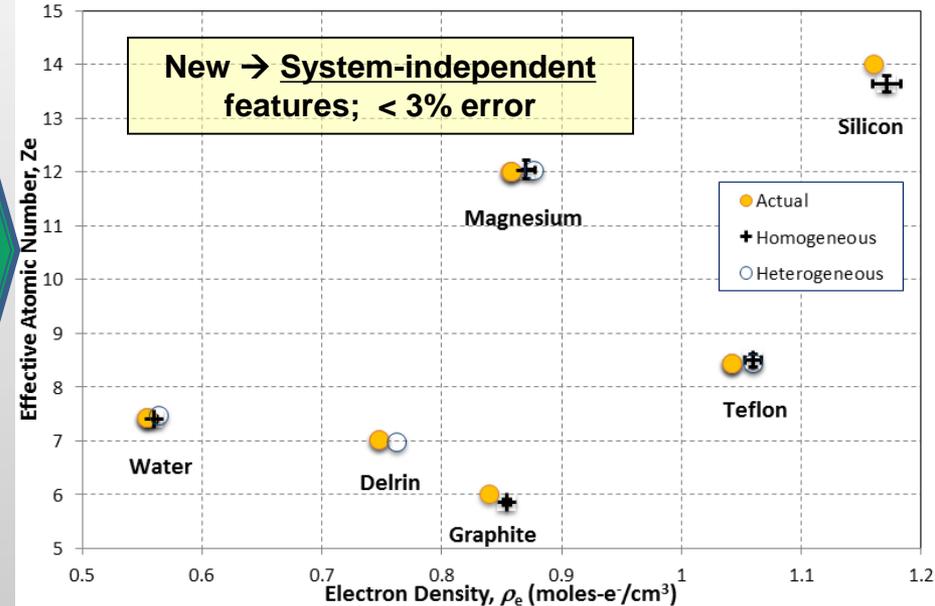

BAD

Ratio (μ_{low}/μ_{high}) vs μ_{high}

GOOD

Z_e vs Electron Density (ρ_e) [PCD Method]

- SIRZ gives system-independent results **without beam-hardening correction (BHC)**
 - Tested with 7 specimens on 4 different CT scanners, 3 different detectors and 5 spectra
- Recommending that DHS and vendors adopt SIRZ for HME characterization and scanner certification; the UK Home Office adopted SIRZ

Outline

- Overview of Nondestructive Characterization at LLNL
- X-ray Radiography, CT, Diffraction and Applications
 - eV-to-MeV X-ray energies; nm-to-cm spatial resolution
 - H-to-Pu Z-range; mg/cm³-to-20g/cm³ in density (ρ)
 - Hair-strand to Cargo-container object sizes
- Software & Supporting Technologies
 - Algorithms for CT acquisition, processing, reconstruction, analysis
 - Simulation & Modeling
- Other Modalities (Ultrasound, Radar, Particles, etc.)
- ➔ ■ Future directions

Future Plans and Challenges

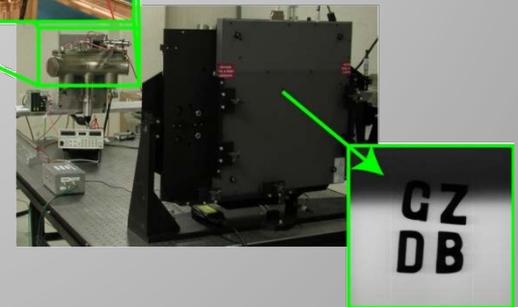

- Quantitative NDC for Additive Manufacturing (AM)
 - Acoustic emission feedback for AM
- NDC for Chip Assurance
 - Nanoscope at synchrotron or with Lyncean
 - X-ray ptychography
 - High-speed nano-CT, limited-view
- Multi-spectral CT coupled with SIRZ
- Additional NCI Goals
 - Faster 3D imaging of dynamic events
 - Fused neutron and x-ray CT algorithms
 - Faster more accurate models
 - Partner with gov't, academia, labs & industry

Destructive analysis (left) used to verify to CT data (right)

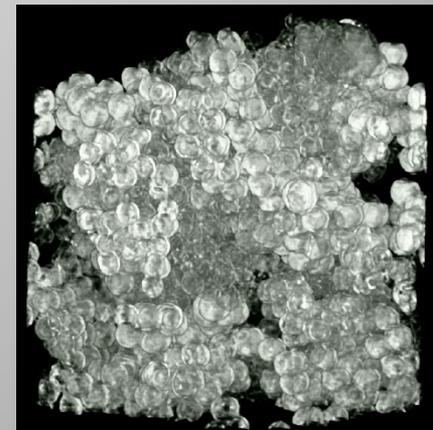

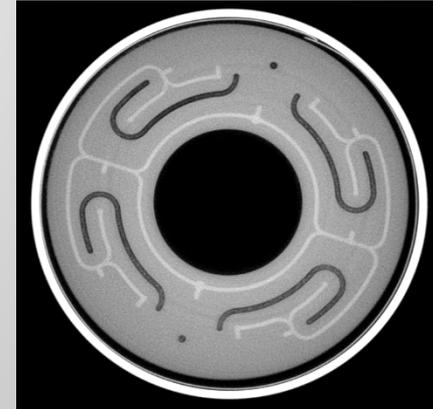

Testing novel x-ray sources – the XinRay 108-element curved array, cold cathode carbon nanotube

With decades of investment, NCI at LLNL is a resource to the nation.

Summary

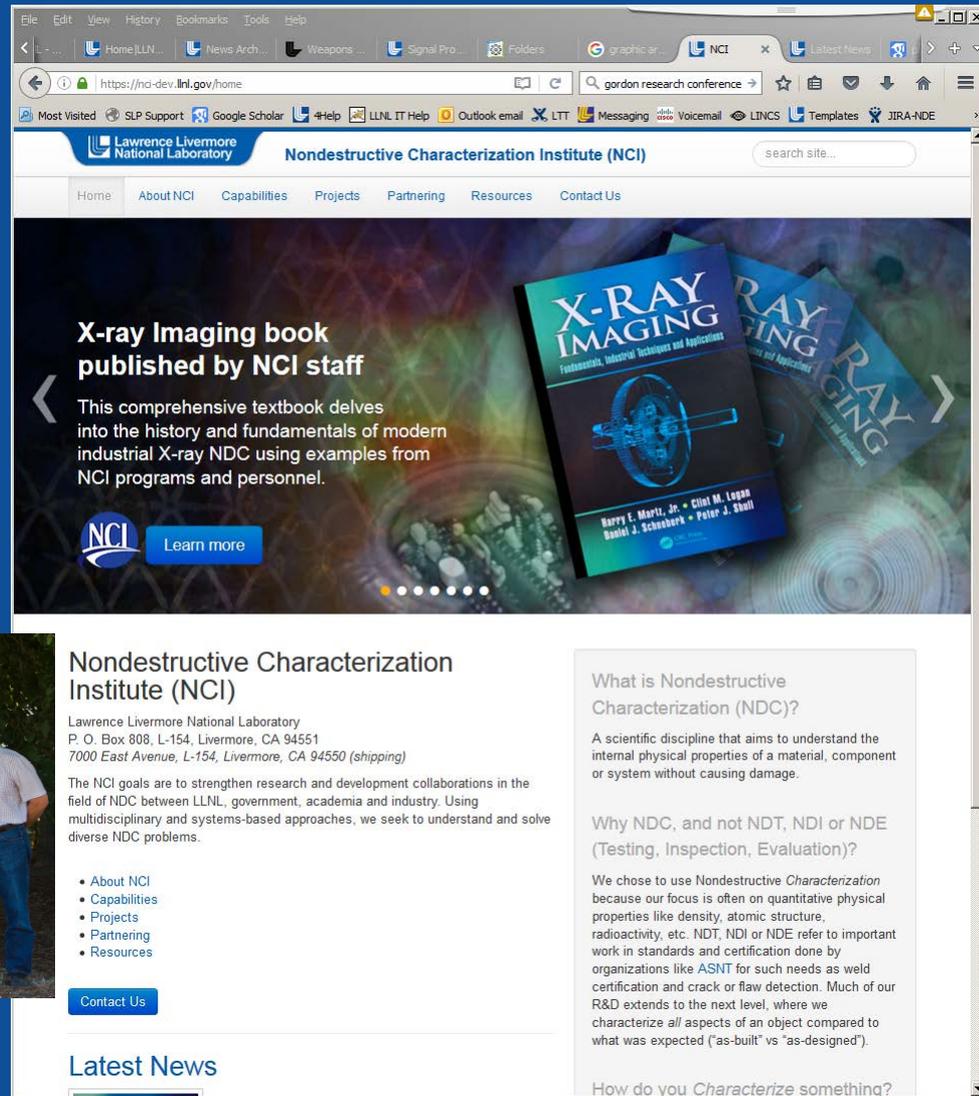

- Nondestructive Characterization (NDC) has been a core competency at LLNL since its inception in 1952
 - Unique facilities and expertise in systems, simulation, algorithms, computations, analysis
 - Started CT in the early 1980's
- Nondestructive Characterization Institute (NCI) is
 - Newly-formed in 2015 from earlier thrusts
 - Growing in expertise and partnerships
- Computed Tomography is core to our work
 - Many CT systems supported; more coming
 - Internal R&D complements our customers' needs
 - We continue to collaborate and address new problems

1- μ m Copper spheres

We build systems and use them to solve multi-agency problems for the U.S.

The screenshot shows a web browser displaying the homepage of the Nondestructive Characterization Institute (NCI) at Lawrence Livermore National Laboratory. The URL in the address bar is https://nci-dev.llnl.gov/home. The page features a navigation menu with links for Home, About NCI, Capabilities, Projects, Partnering, Resources, and Contact Us. A search bar is located in the top right corner. The main content area is dominated by a large banner for an X-ray imaging book. The banner includes the text: "X-ray Imaging book published by NCI staff", "This comprehensive textbook delves into the history and fundamentals of modern industrial X-ray NDC using examples from NCI programs and personnel.", and a "Learn more" button. To the right of the text is an image of the book cover, which is titled "X-RAY IMAGING: Fundamentals, Industrial Techniques and Applications" and lists authors Harry E. Moritz, Jr., Clint M. Logan, Daniel J. Schuszberg, and Peter J. Shull. Below the banner, there is a section titled "Nondestructive Characterization Institute (NCI)" with the address: "Lawrence Livermore National Laboratory, P. O. Box 808, L-154, Livermore, CA 94551, 7000 East Avenue, L-154, Livermore, CA 94550 (shipping)". A paragraph describes the NCI's goals: "The NCI goals are to strengthen research and development collaborations in the field of NDC between LLNL, government, academia and industry. Using multidisciplinary and systems-based approaches, we seek to understand and solve diverse NDC problems." Below this text is a list of links: "About NCI", "Capabilities", "Projects", "Partnering", and "Resources", followed by a "Contact Us" button. To the right of this section is a sidebar titled "What is Nondestructive Characterization (NDC)?" which defines the discipline as "a scientific discipline that aims to understand the internal physical properties of a material, component or system without causing damage." It also includes a section "Why NDC, and not NDT, NDI or NDE (Testing, Inspection, Evaluation)?" and a paragraph explaining the choice of NDC: "We chose to use Nondestructive Characterization because our focus is often on quantitative physical properties like density, atomic structure, radioactivity, etc. NDT, NDI or NDE refer to important work in standards and certification done by organizations like ASNT for such needs as weld certification and crack or flaw detection. Much of our R&D extends to the next level, where we characterize all aspects of an object compared to what was expected ('as-built' vs 'as-designed')." At the bottom of the sidebar is a link: "How do you Characterize something?". On the left side of the page, there is a group photo of approximately 20 people standing outdoors in front of trees.
